Approach-Avoidance Conflict

Approach-Avoidance Conflict

Threat-Avoidance in Clinical Anxiety

Understand the
psychological and neural
processes underlying costly
avoidance

Understand anxiety-related
abnormalities in these
processes

**Inform
psychological
treatments for
clinical anxiety**

Psychological Processes Engaged by Approach-Avoidance Conflict

Perceive stimuli

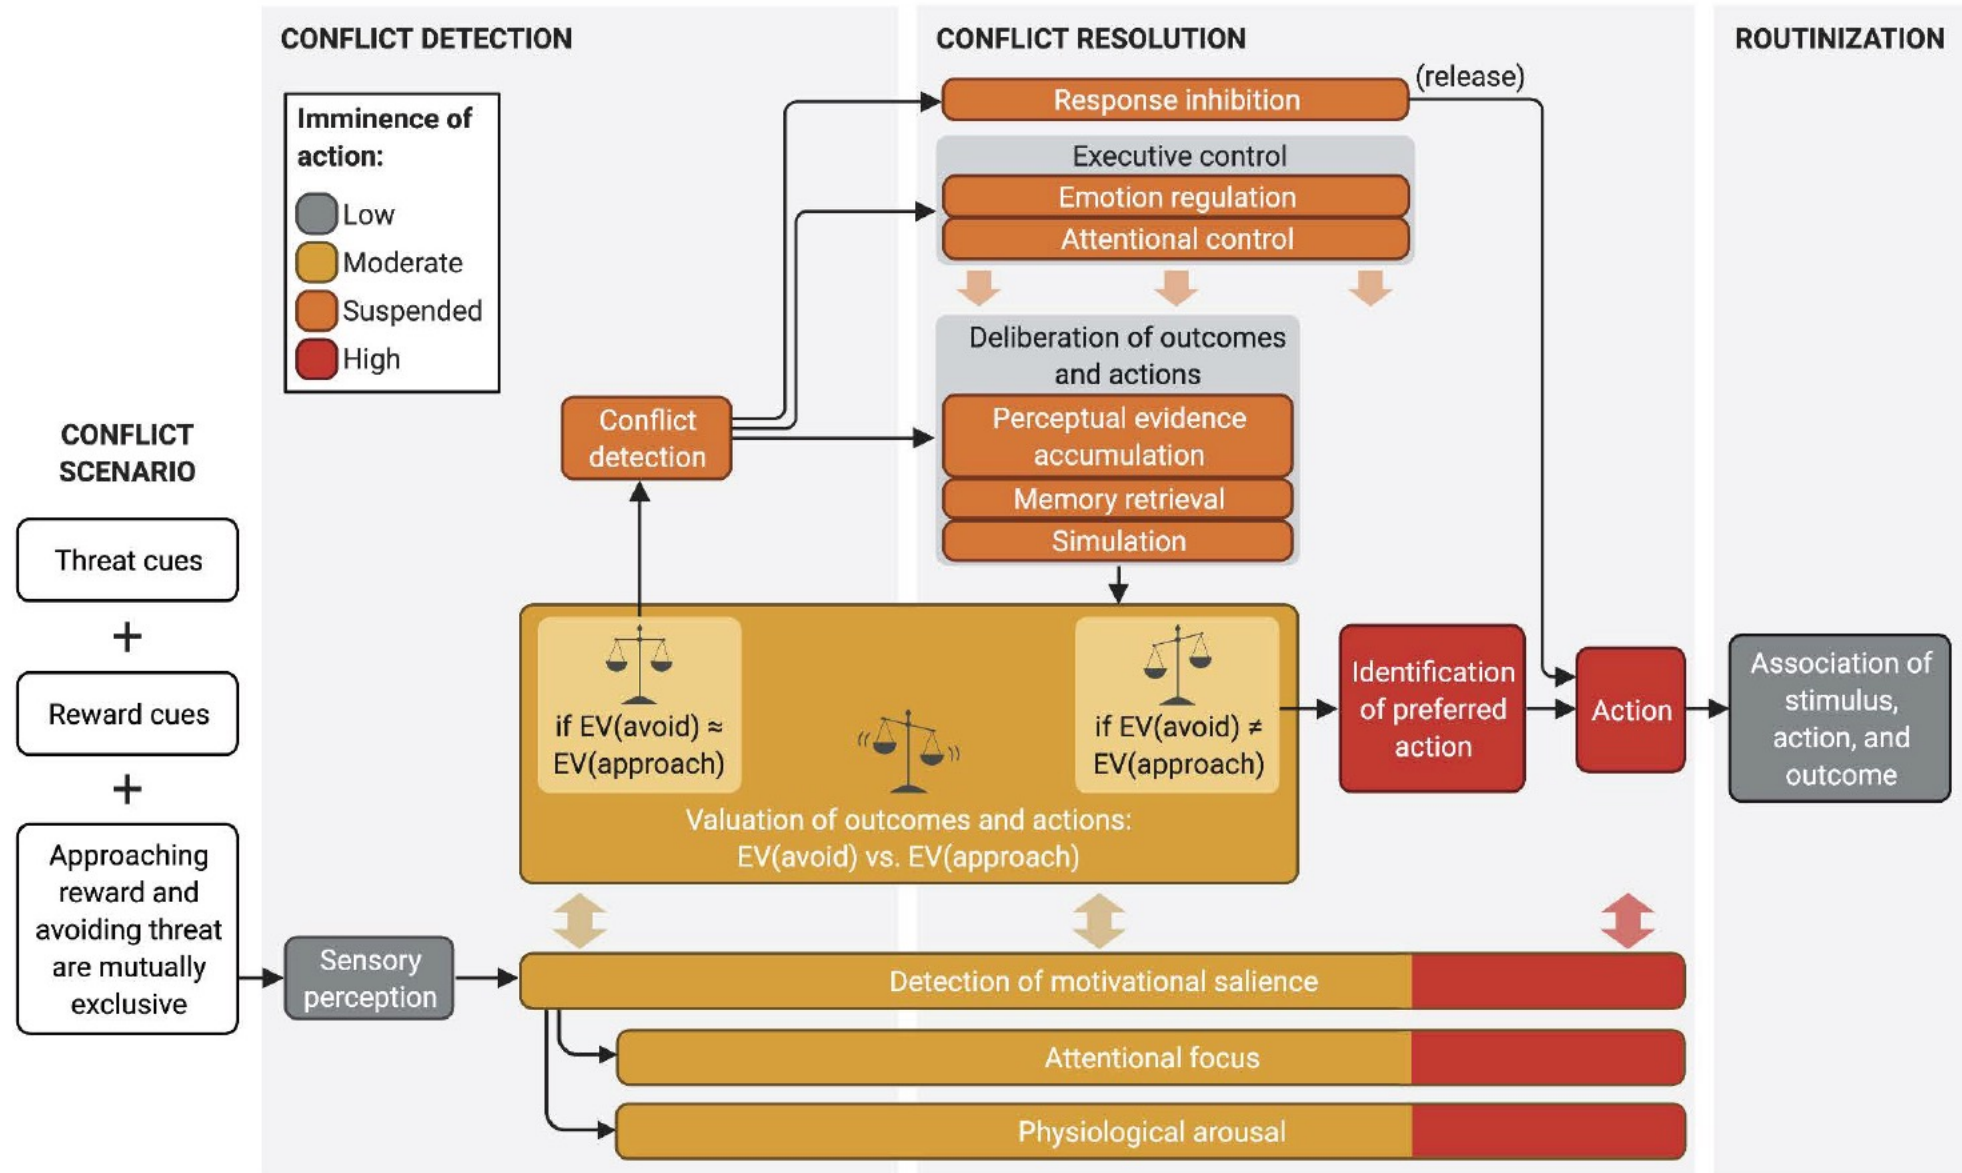

Deliberate

Act

Psychological Processes Engaged by Approach-Avoidance Conflict

Specific Questions

1. What are the neural and psychological processes that underlie initial responding to threat-related cues?

effects of anxiety

2. How are the expected values of various outcomes and options computed during deliberation, and how does this influence choice?

effects of anxiety

3. What deliberative brain processes are most predictive of choice?

effects of anxiety

Study Introduction

Choose & Travel

Outcome
(shock, win, both, or neither)

Instrumental Trial Types

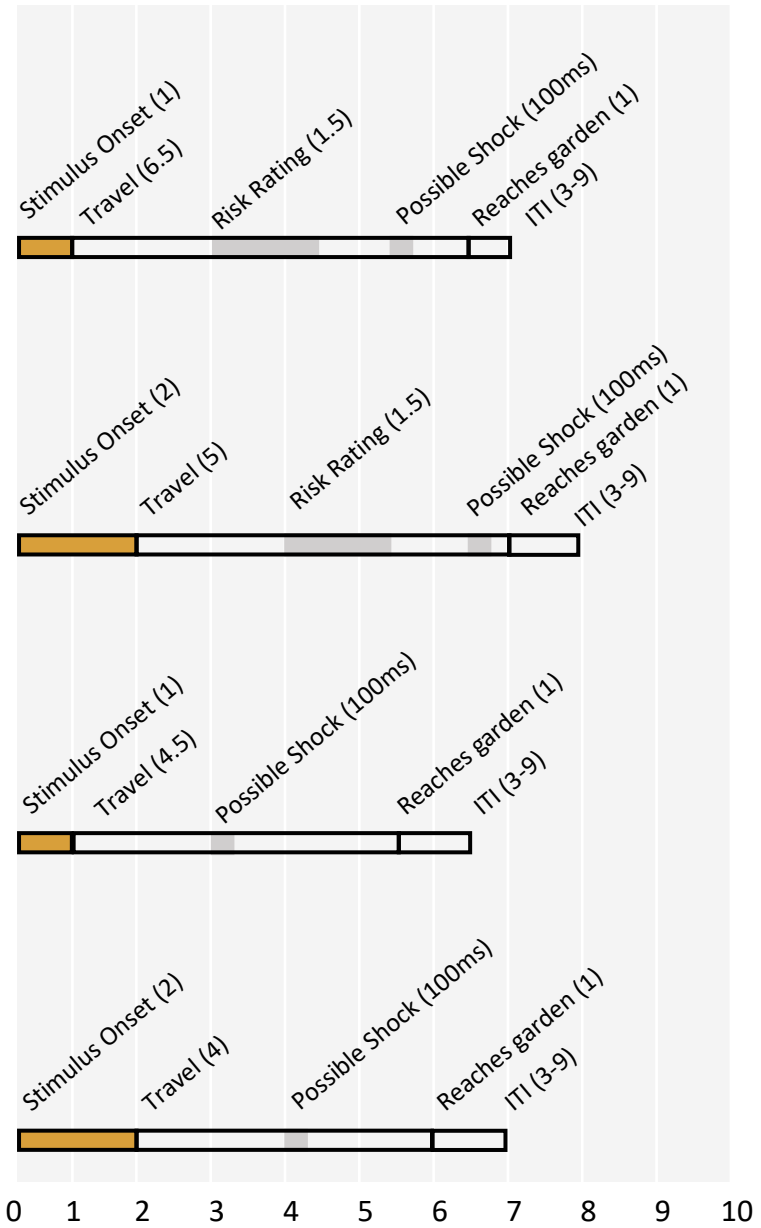

Certain Win

Uncertain Win

No-Choice Trials

Choice Trials

Data Collection and Analysis

Procedure

- Clinical interview
- Questionnaires
- Shock workup
- Farmer task during fMRI

fMRI Acquisition

- 3T Siemens MAGNETOM Prisma with 32-channel head/neck coil
- T2*-weighted EPIs (2mm resolution, multiband sequence, whole brain, axial slices, TR: 1500ms)
- T1-weighted MP-RAGE sequences (1.0 mm sagittal slices; TR=2300ms)

fMRI Analysis

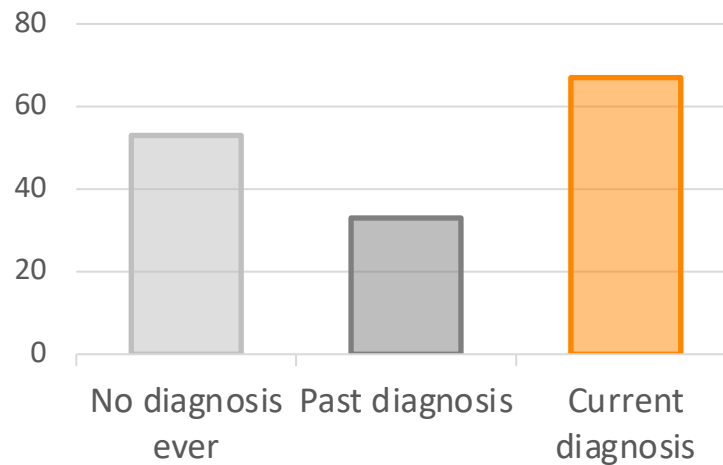

- Warp anatomical images to MNI space with AFNI's SSwarper
- Register functional volumes to warped anatomical

Participants

Full Sample:

n=153

Any Current Anxiety-Related Dx	67 (43.79%)
Current Generalized Anxiety Disorder	27 (17.65%)
Current Post-Traumatic Stress Disorder	18 (11.76%)
Current Social Anxiety Disorder	22 (14.38%)
Current Obsessive-Compulsive Disorder	7 (4.58%)
Current Specific Phobia	9 (5.88%)
Current Comorbid Major Depressive Disorder	16 (10.46%)
Current Comorbid Dysthymia	7 (4.58%)
No Psychiatric Dx Ever	53 (34.64%)

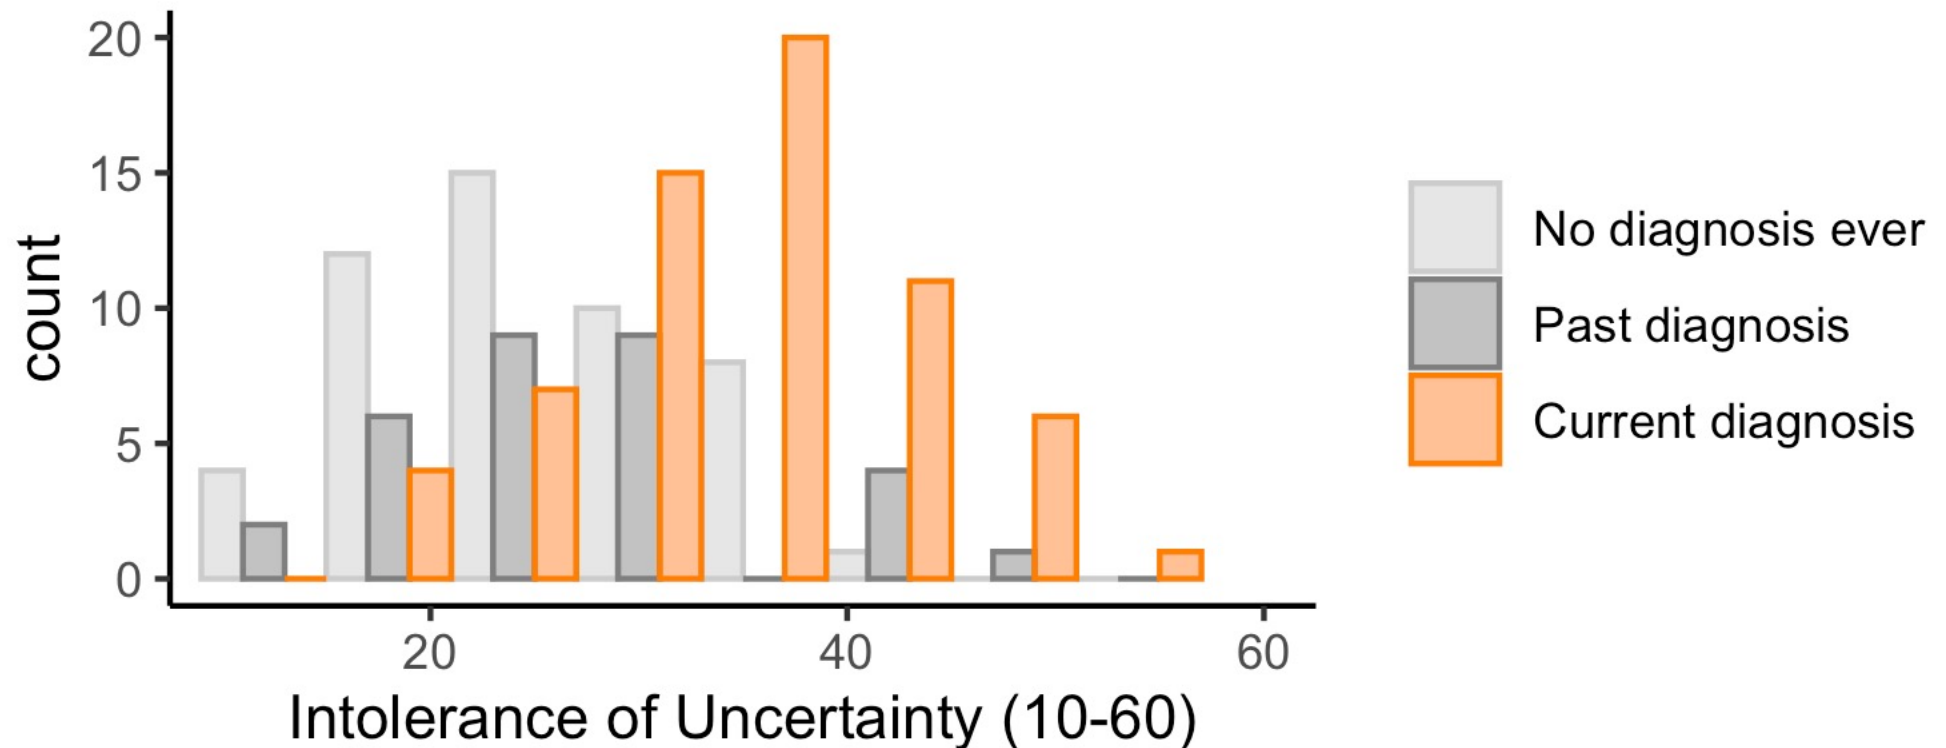

Intolerance of Uncertainty

Intolerance of Uncertainty Scale – Short Form (Carleton et al., 2007)

“Unforeseen events upset me greatly”

“One should always look ahead so as to avoid surprises”

“The smallest doubt can stop me from acting”

Directions

Behavioral Index of Pavlovian Fear

Neural Indices of Pavlovian Fear

- Standard fMRI preprocessing: slice-time correction and spatial smoothing
- GLM with AFNI's 3dDeconvolve
 - IVs: Task events
 - Covariates: baseline drift, 6 motion parameters, timecourse of shock delivery
- Group analysis with AFNI's 3dttest++
 - CS+ vs. Δ CS- contrast

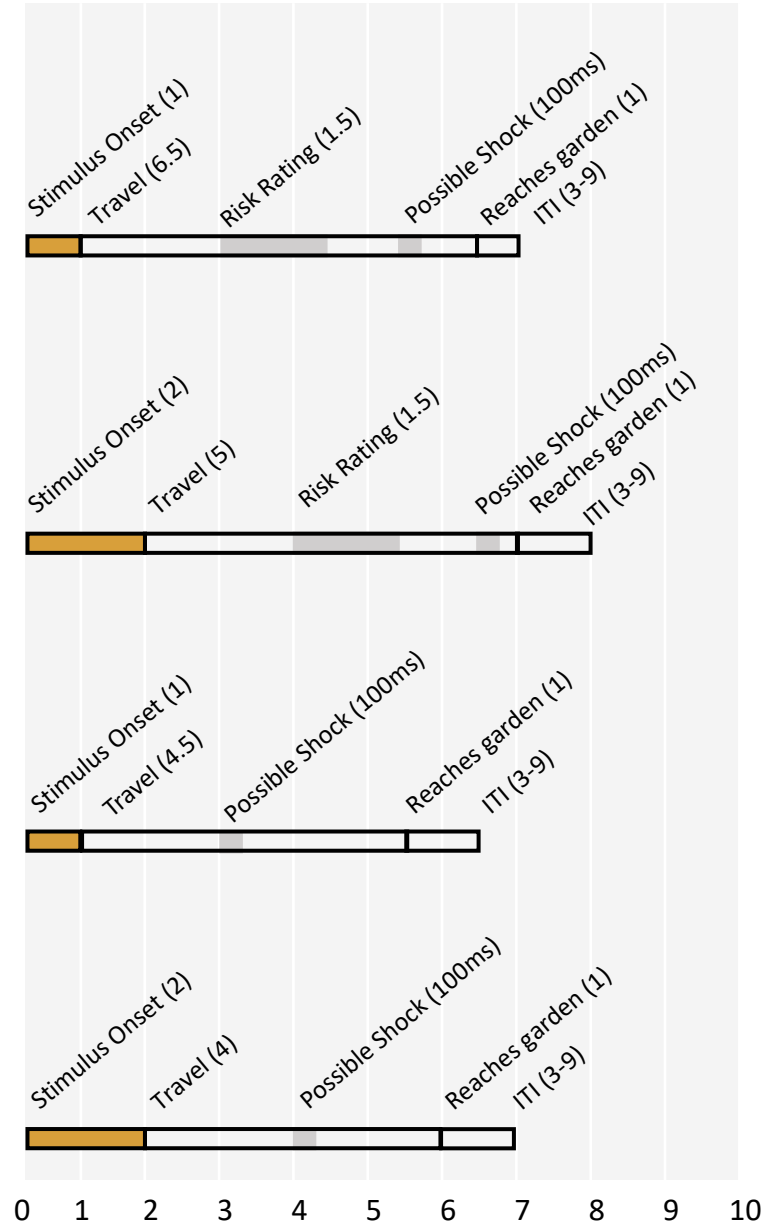

Instrumental Avoidance

Assessing Generalization

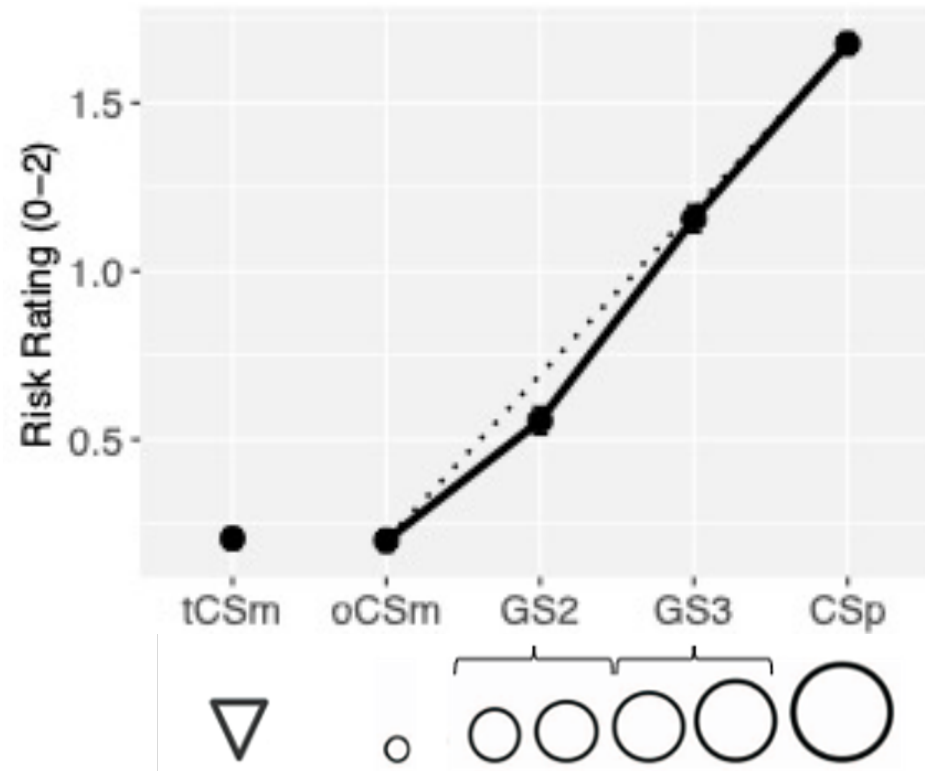

- Compare Pavlovian and instrumental responding across stimuli

Assessing Pavlovian-Instrumental Covariation

- Assess association of Pavlovian fear with avoidance

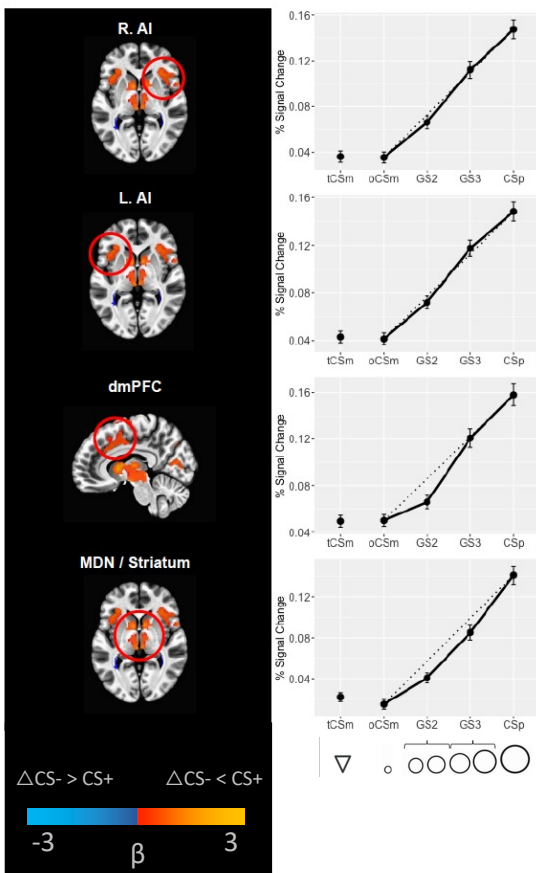

Generalization of Conditioned Shock-Expectancy

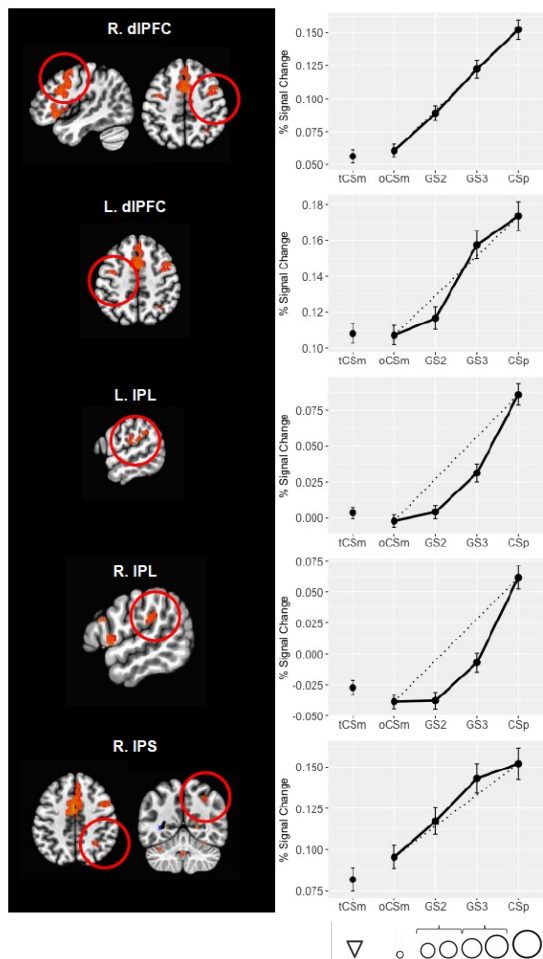

Neural Substrates of Pavlovian Fear

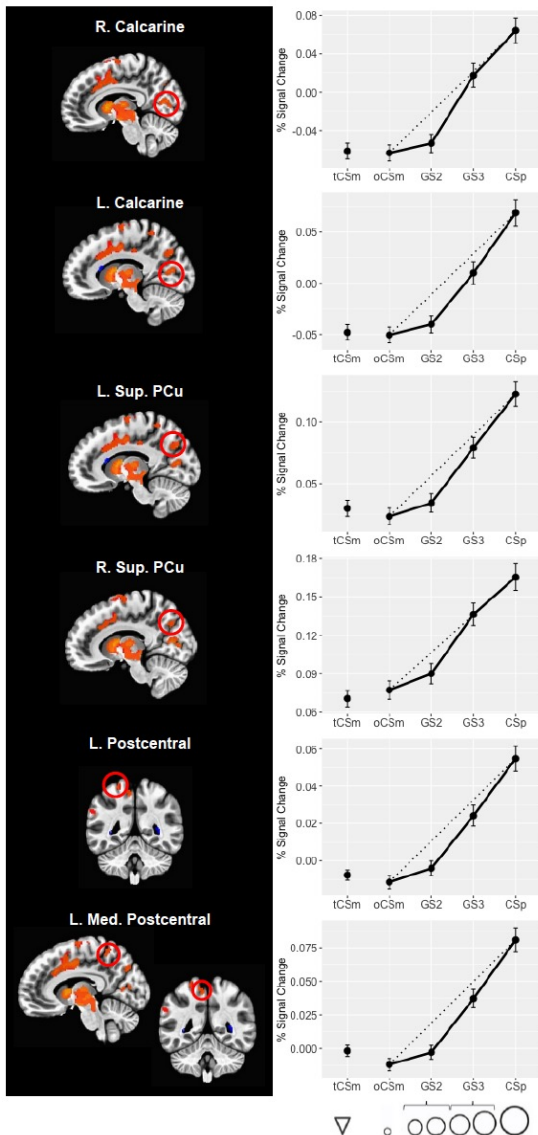

Salience Network

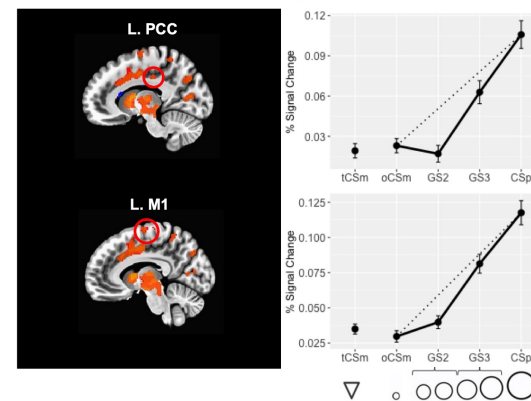

Frontoparietal Control Network

Outcome

Computing Expected Value

Expected Value

$$\text{Expected Value} = \text{Value} * \text{Probability}$$

**Expected Value
for an action**

$$\text{Expected Value (action)} = \text{Value (outcome)} * \text{Probability (outcome | action)}$$

**Expected Value
for an action
relative to another action**

$$\text{Expected Value (action A)} = \text{Value (outcome)} * [\text{Probability (outcome | action A)} - \text{Probability (outcome | action B)}]$$

**Expected Value
for an action
in the present experiment**

$$\text{Expected Risk (approach)} = \text{Value(shock)} * [\text{Probability (shock | approach)} - \text{Probability (shock | avoid)}]$$

$$\text{Expected Reward (approach)} = \text{Value(win)} * [\text{Probability (win | approach)} - \text{Probability (win | avoid)}]$$

Decision-
Making

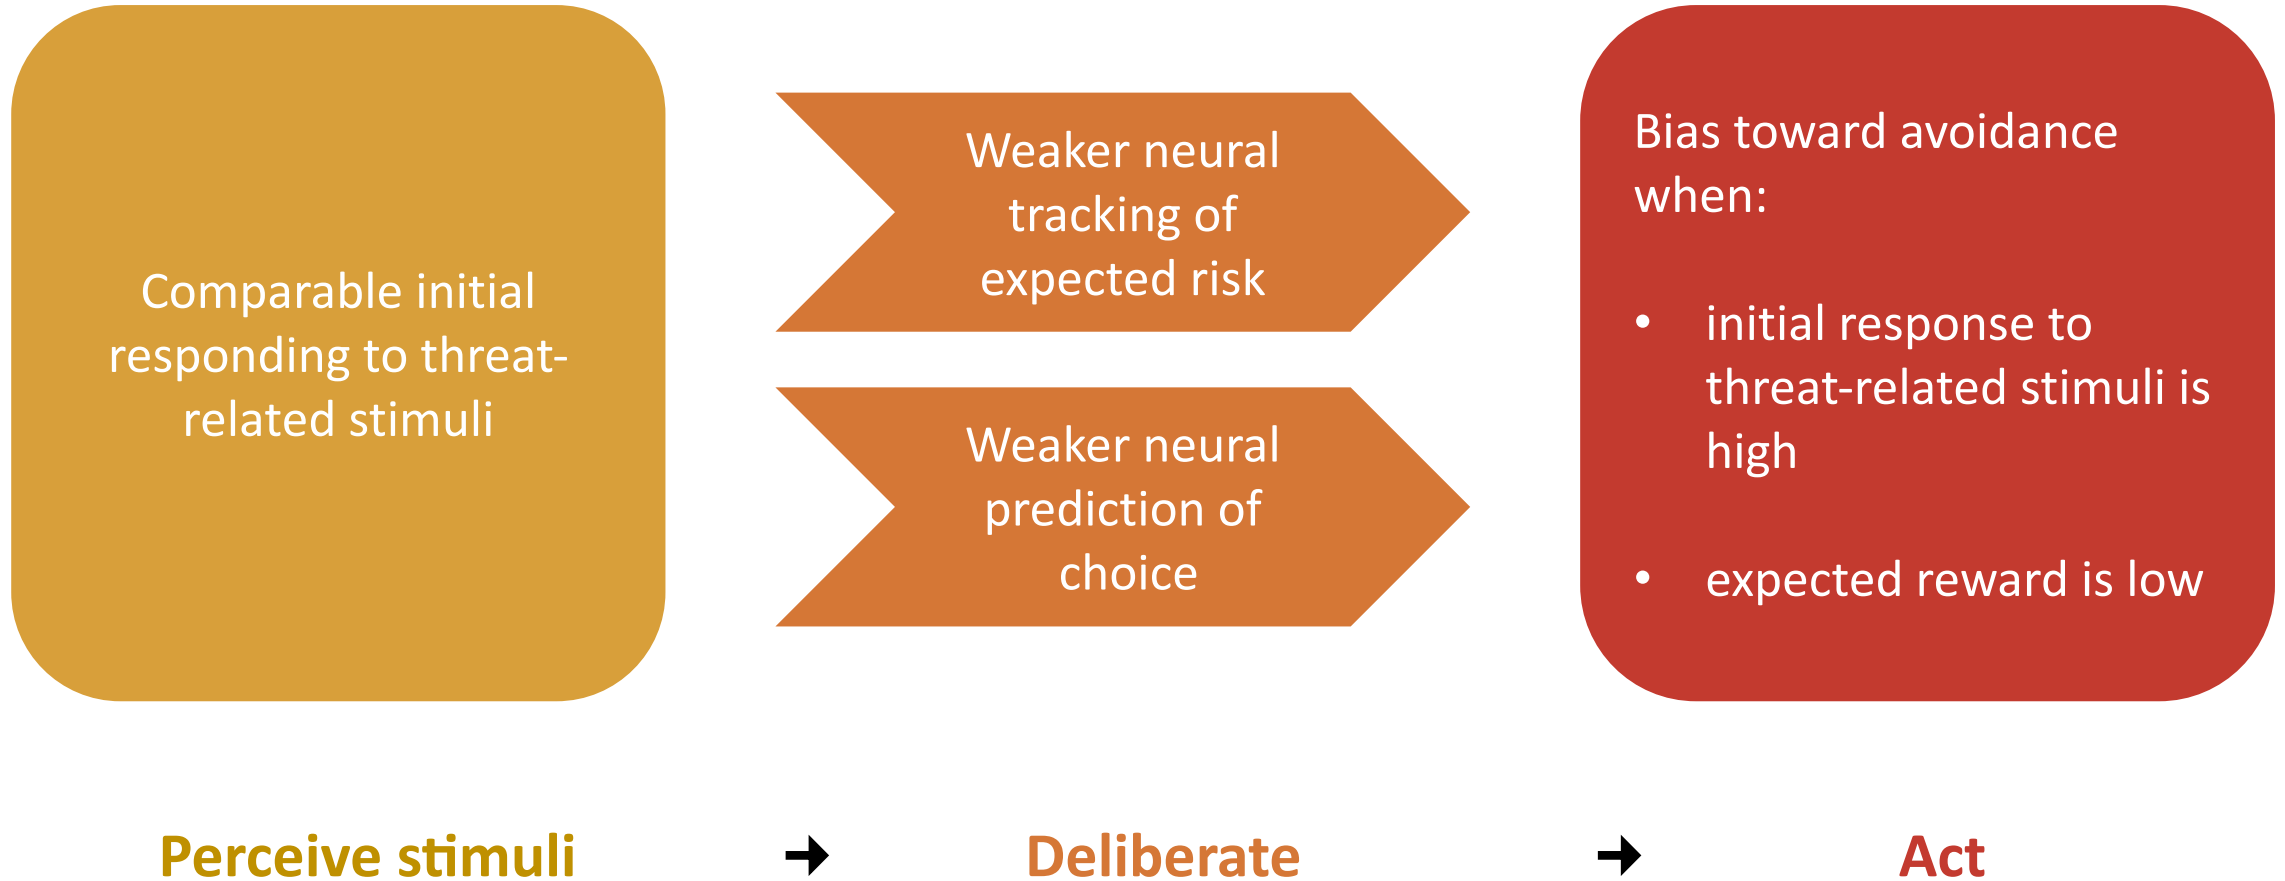

**Discussion
and Future
Directions**

Summary of Findings: How Avoidance Decisions are Made

Summary of Findings: Effects of Anxiety-Related Traits

Inconsistent, Ineffective Deliberation

Low IU

Routinized, Prepotent Approach Response
Deliberate Only When Needed
Act According to Results of Deliberation

→ Approach

→ Deliberate → Avoid

High IU

Routinized, Prepotent Approach Response
Deliberate Often
Act According to Results of Deliberation

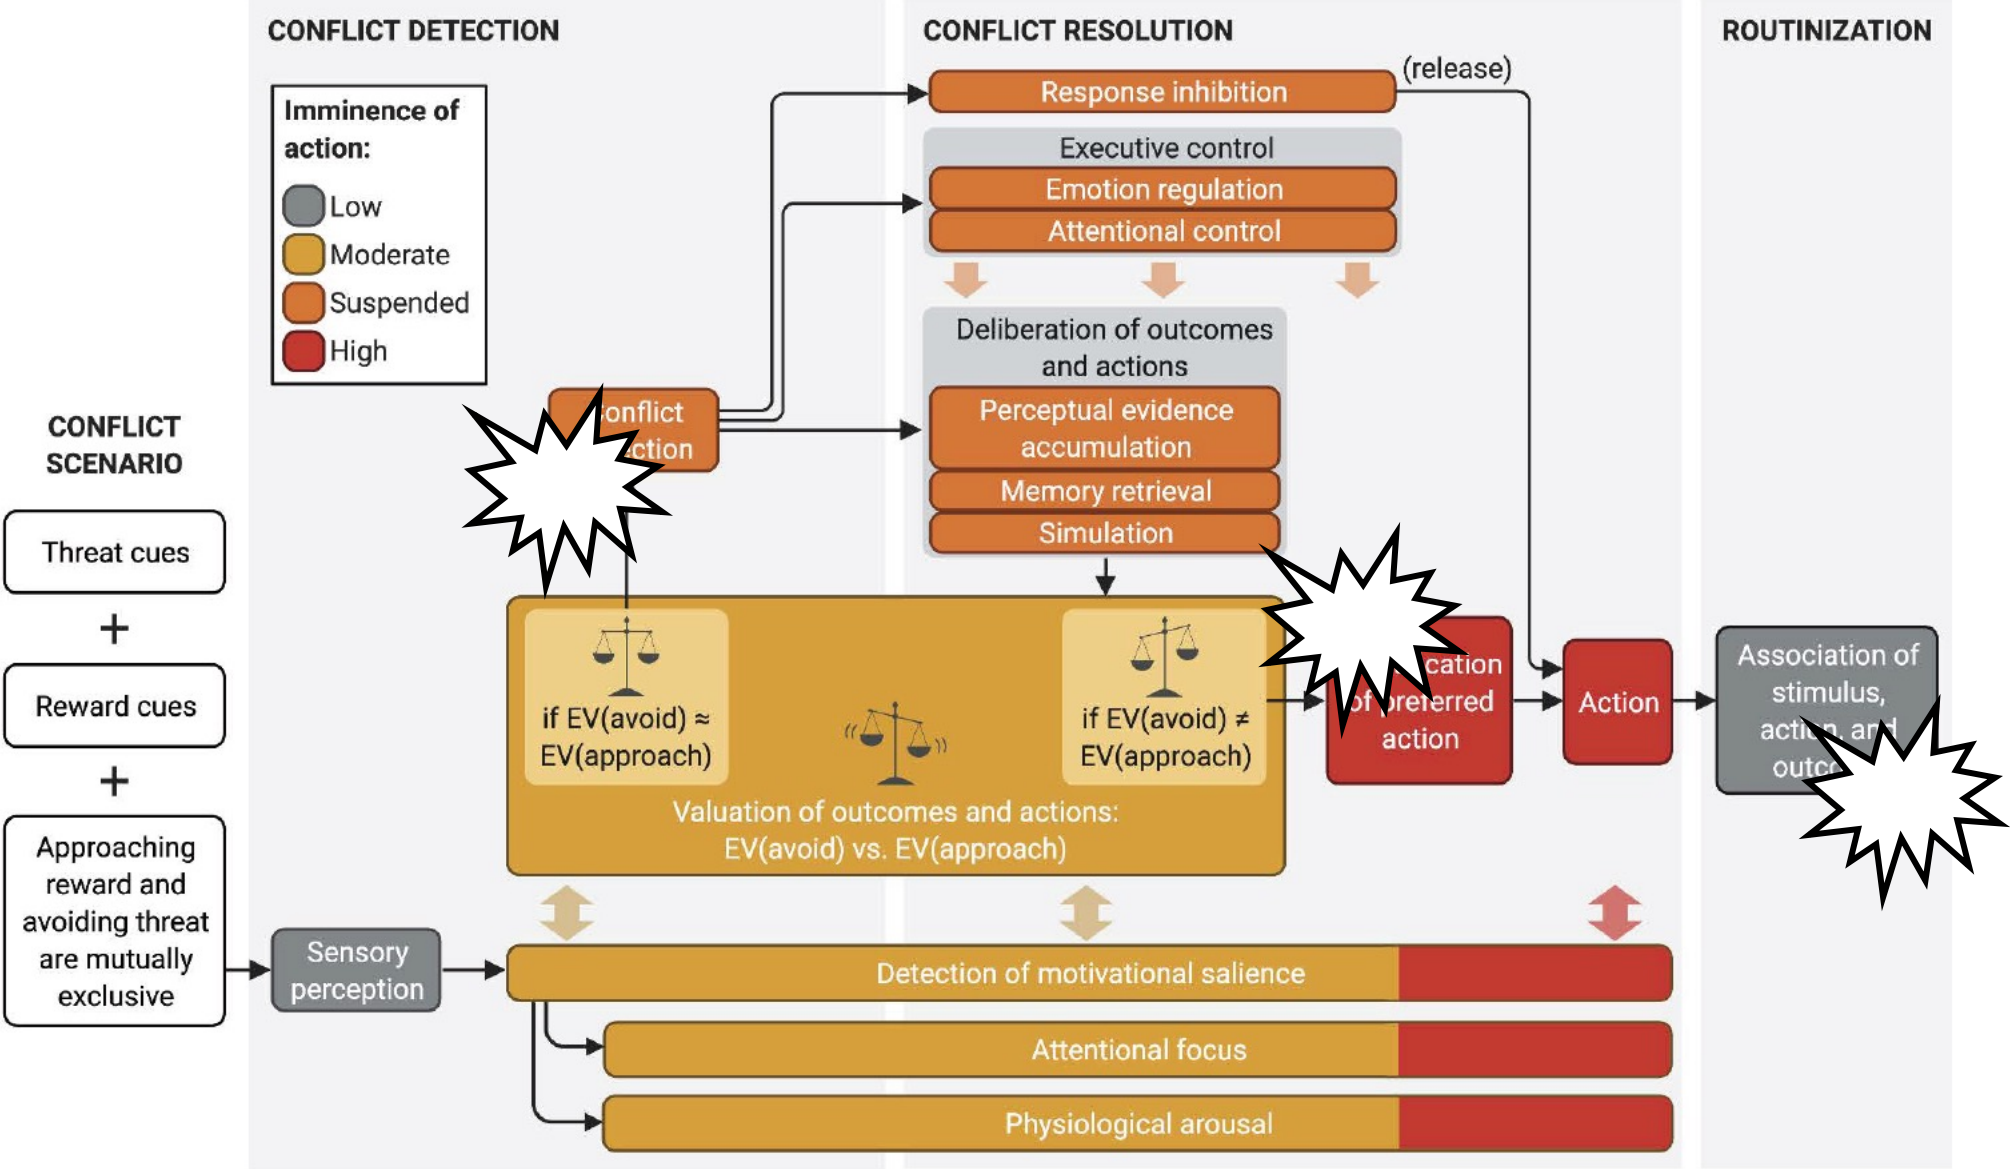

→ Deliberate → Approach

→ Deliberate → Avoid

→ Deliberate → Avoid

Inconsistent, Ineffective Deliberation

Future Directions

Compare contributions of various anxiety-related traits to excessive avoidance

Identify the relevance of anxiety-related abnormalities in decision-making for symptom severity and treatment response

Develop and test targeted treatments
